In-class check: Binary Search Rank

COSC 2230 (CS III) Fall 2026 · Augustana U. · Monday, October 26

5 minutes. Closed book, laptops closed.

The array is sorted:

```
a = [ann, bob, bob, cat]
```

What does `search()` from the Binary Search Rank assignment return for these keys?

1. `bob`: _____
2. `bo`: _____
3. `dan`: _____
4. The binary search from class also finds a `bob` in this array. Why can't the `search()` of the assignment stop as soon as it finds one?

Extra, if you finish early: what does `search()` return for `aaa`, and why is that a problem for a client?
